Abstract of JP 2001178734 (A)

PROBLEM TO BE SOLVED: To provide an electric therapeutic system allowing an operator to connect various probes to the system and to operate means for water supply and sucking according to probes to be connected. **SOLUTION:** A hand-piece 5 for ultrasonic coagulation incision, for ultrasonic sucking, etc., can be selectively connected to an ultrasonic output device 1. A water supply/sucking device 2 is connected to the ultrasonic output device 1 by way of a communication cable 3. A probe discriminating resistance 22 is mounted inside a connector 6 of the hand-piece 5. The ultrasonic output device 1 discriminates a hand probe connected according to the resistance value of the probe discriminating resistance 22 by a probe discriminating part 13, and whether the hand probe can be interlocked with the water supply/sucking device 2 or not is determined by a control part 11 according to the discriminated hand probe.
